## SECTION 3

### SET-UP ADJUSTMENTS

- The following adjustments should be made when a complete realignment is required or a new picture tube is installed.
- These adjustments should be performed with rated power supply voltage unless otherwise noted.

Controls and switch should be set as follows unless otherwise noted :

PICTURE control . . . . . RESET  
BRIGHTNESS control . . . . . center

Perform the adjustments in order as follows :

1. Beam Landing
2. Convergence
3. Focus
4. White Balance

**Note :** Test Equipment Required.

1. Color-bar/Pattern Generator
2. Degausser
3. Oscilloscope

#### Preparations :

- In order to reduce the influence of geomagnetism on the set's picture tube face it east or west.
- Switch on the set's power and degauss with the degausser.

#### 3-1. BEAM LANDING

1. Input the white signal with the pattern generator.  
Contrast } normal  
Brightness }
2. Position neck ass'y as shown in Fig 3-2.
3. Set the pattern generator raster signal to red.
4. Move the deflection yoke to the rear and adjust with the purity control so that the red is at the center and the blue and the green take up equally sized areas on each side.  
(See Figures 3-1 through 3-3.)
5. Move the deflection yoke forward and adjust so that entire screen is red. (See Figure 3-1.)
6. Switch the raster signal to blue, then to green and verify the condition.
7. When the position of the deflection yoke has been decided, fasten the deflection yoke with the screws.

PICTURE ..... minimum
- 4) Select SBR with **1** and **4**, and adjust SBR level with **3** and **6** so that the stripe second from the right is dimly lit.

## SECTION 4 CIRCUIT ADJUSTMENTS

### 4-1. ADJUSTMENTS WITH COMMANDER

Service adjustments are made with the RM-845 that comes with this unit.

#### Entering service mode

With the unit on standby

↓  
"DISPLAY"

↓  
"5"

↓  
"VOL (+)"

↓  
"POWER"

This operation sequence puts the unit into service mode.

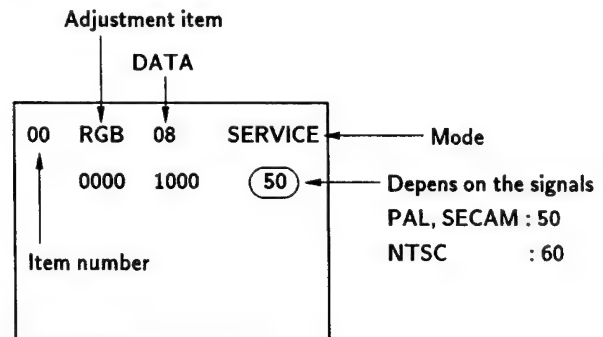

"1", "4"	Raise/lower the service item number
"3", "6"	Raise/lower the data
"MUTE"	Writes
"0"	Executes the writing

"7", "0"	The data all becomes the values in memory
"8", "0"	User control all goes to the standard state
"9"	H-FRE automatic adjustment
"5", "0"	Service data initialization (Be sure not to use usually.)
"2", "0"	Write 50Hz adjustment data to 60Hz, or in opposition.

RM-845 P

The screen display is :

"1", "4"	Select the adjustment item.
↓	
"3", "6"	Raise/lower the data.
↓	
"MUTE"	Writes
↓	
"0"	Executes the writing.

## 4-2. ADJUSTMENT METHOD

### Item Number 24

This explanation uses V-SHFT as an example.

1. Select 24 V-SHFT with the "1" and "4" buttons.
2. Raise/lower the data with the "3" and "6" buttons.
3. Select the optimum state. (The standard is for 0F PAL reception.)
4. Write with the MUTE button. (The display changes to blue WRITE.)
5. Execute the writing with the "0" button. (The WRITE display changes briefly to red.)

Adjusted with "3" and "6" buttons

Written with "MUTE"

Write excuted with "0"

Use the same method for Items Number 00-5E. Use "1" and "4" to select the adjustment item, use "3" and "6" to adjust, write with "MUTE", then execute the write with "0".

**Note :** In "WRITE", the data of all items are wrote together to memory.

- H-FRE can be adjusted automatically. Feed a standard signal and input "9", the automatic adjustment is executed.
- As for V-FREQ, by searching the bolded screen V range with adjusting data.

**Note :** In item 02 50Hz, or item 03 60Hz, it operates normally in spite of the 50Hz or the 60Hz of the input signal. Therefore be sure to adjust data according to the input signal.

The block diagram illustrates the video processing system for the 1000 Series. It shows the flow of video signals from the 1" CBUS INTERFACE through various processing blocks to the PAL/NTSC DEMODULATOR and IDENTIFICATION block. Key components include:

- 1" CBUS INTERFACE**: Receives input signals (I, Q, N) and provides output signals (I, Q, N).
- VERTICAL SYNC**: Processes vertical sync signals.
- TIMING**: Provides timing signals to other blocks.
- PHASE2**: Processes phase signals.
- VERTICAL SAWTOOTH**: Generates vertical sawtooth signals.
- GEOMETRY PROCESSOR**: Processes geometry signals.
- SYNC SEPARATOR**: Separates sync signals from the input.
- HORIZONTAL PLL**: Phase-locked loop for horizontal sync.
- SWITCH**: Two switches that route signals between the input and the processing blocks.
- ACC**: Accumulator block.
- CLOCK FILTER**: Filters the clock signal.
- FOCTAL**: Frequency-to-orthogonal-to-analog converter.
- SECAM DEMODULATOR**: Demodulates SECAM signals.
- IDENTIFICATION**: Identifies the video signal format.
- CHROMINANCE BANDPASS**: Filters the chrominance signal.
- PLL**: Phase-locked loop for color.
- HUE**: Hue control block.
- PAL/NTSC DEMODULATOR**: Demodulates PAL/NTSC signals.
- BIAS**: Provides bias signals.
- DELAY**: Delays the video signal.
- TRAP**: Traps unwanted signals.
